Is the intended use of the service intuitive?

For the most part, the service was intuitive. I could rely on my experience with creating accounts and logging in, using clues on the logged-in home page to figure out what to do next. However, a notable issue arose after account creation: the application didn't redirect users back to the login screen. Even if it hadn't redirected us, there was no way to navigate back to the login page, which could leave someone less tech-savvy unsure of how to proceed. Adding moons was another unintuitive aspect; users had to navigate to the planet and then return to add a moon, making the process feel unnecessarily complicated.

Is the service easy to use?

I think the service is easy to use, if you can have the knowledge how to click the back button or know how links work and get back to the log in screen to get over the hurdle after making the account, and just exploring the home page of how to delete. After that I believe the application is easy to use, the textbox tells you what you need to add a planet or moon and how to remove them. The only problem with the ease of use, since the moons aren't linked to users, so users may accidentally delete each other's moon, and they wouldn't know until they looked at their account and the person doing the deleted wouldn't know and may be confused why their moon is still on the planetarium.

Does the service inspire confidence?

This application doesn't inspire confidence in me because it has significant shortcomings in basic security and functionality. For instance, during account creation, it reveals the username and password in plaintext through a popup, and the password is stored in the database without encryption. Additionally, the application fails to meet software requirements by not making images mandatory for planets and moons. These unresolved issues inspire little confidence in the overall reliability of the application and its ability to make the end-user happy with the service.

Is the service pleasing to look at?

I think the service is pleasing to look at overall. However, the login and account creation screens could benefit from a visual update—perhaps by adding a background image of space, planets, or moons, instead of a pitch-black background. I really enjoy the space theme on the logged-in home screen; it evokes a sense of exploration, and the formatting of basic information about each planet and moon is well done. I appreciate how everything is aligned in the center of the page.

That said, I have a couple of minor issues. When the browser isn't set to full screen, the images don't scale properly, so they remain the same size, which affects the overall appearance. Additionally, I noticed that the information in the gray column isn't quite centered; it appears slightly off, which is a small detail that could enhance the visual consistency.
